

# D1.2 – Report and database on commercial consolidants and protective coatings

## Project Information

<b>Grant Agreement Number</b>	646178
<b>Project Full Title</b>	Nanomaterials for conservation of European architectural heritage developed by research on characteristic lithotypes
<b>Project Acronym</b>	NANO-CATHEDRAL
<b>Funding scheme</b>	NMP-21-2014 Materials-based solutions for protection or preservation of European cultural heritage
<b>Start date of the project</b>	June, 1 2015
<b>Duration</b>	36 months
<b>Project Coordinator</b>	Andrea Lazzeri (INSTM)
<b>Project Website</b>	<a href="http://www.nanocathedral.eu">www.nanocathedral.eu</a>

## Deliverable Information

<b>Deliverable n°</b>	1.2
<b>Deliverable title</b>	Report and database on commercial consolidants and protective coatings
<b>WP no.</b>	1
<b>WP Leader</b>	INSTM
<b>Contributing Partners</b>	INSTM, OPAE, COLOR, CS, IATCS, ARCHI, DNO, ISCR
<b>Nature</b>	Elaboration Database File (.pdf); database (.xls)
<b>Authors</b>	Francesca Gherardi, Lucia Toniolo
<b>Contributors</b>	Sabrina Bianchi, Valter Castelvetro, Valentina Dami, Luciana Festa, Cristoforo Galimberti, Resty Garcia, Elisabeth Ghaffari, Francesca Gherardi, Ignace Roelens, Marco Roveri, Giancarlo Sidoti, Francesco Sortino, Anton Sutter, Johannes Weber
<b>Reviewers</b>	Marco Lezzerini, Valter Castelvetro
<b>Contractual Deadline</b>	30.09.2015
<b>Delivery date to EC</b>	18.11.2015

## Dissemination Level

5	Database on research products .....	82

Annex 1: technical forms for commercial and research products

Annex 2: technical forms collected from the Partners on commercial products

Annex 3: technical forms collected from the Partners on research products

## 1 Aim of the research

The aim of this research is to provide a database of the most applied commercial products and the most relevant research products from the current scientific literature in Europe for the consolidation and the protection of natural decayed stones. Two technical forms (Annex 1) were set-up and sent to the Partners for the survey: the first one related to available commercial products<sup>1</sup> and the second one to the research products<sup>2</sup>.

The collected data (Annex 2 and 3) are, therefore, coming from the Project Partners on the basis of their experience and the elaborated data are strictly connected to this provenance; they do not include all the commercial or research products available.

## 2 Structure of the database

The structure of the database is reported in Fig. 1 and it divided in two main categories: commercial products and research products. Both categories collect the forms of consolidants and protective/antifouling coatings, which in turn have been collected according to their chemical class.

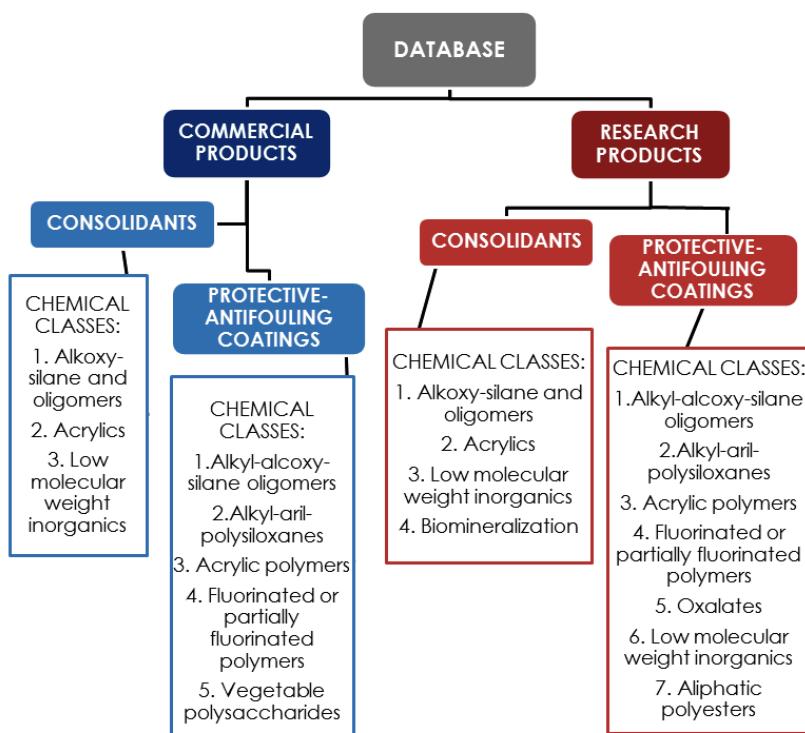

Fig.1: structure of the database.

<sup>1</sup> Commercial product: material currently available on the market equipped with a trademark and trade name and a Technical datasheet.

<sup>2</sup> Research product: material, nano-material, chemical compound, inorganic molecule, oligomer, polymer not available on the market, prepared in the lab or supplied for research aims.

### 3 Evaluation of the data collected with the survey

#### 3.1 Commercial products

Among commercial products, the total number of different consolidant materials is 37. They can be divided in three main chemical classes: alkoxy-silane and oligomers, acrylics and low molecular weight inorganics (Fig. 2). Among them, 12 contain nanoparticles in the formulation, in particular  $\text{Ca}(\text{OH})_2$ ,  $\text{SiO}_2$ ,  $\text{ZrO}_2$ ,  $\text{Al}_2\text{O}_3$  nanoparticles (Fig. 3). Regarding the dispersing media, the most used ones are the organic solvents (Fig. 4).

Among commercial products, the total number of different protective coatings is 21, 2 of which have antifouling properties. They can be divided in 5 chemical classes: alkyl-alcoxy-silane oligomers, alkyl-aryl-polysiloxanes, fluorinated or partially fluorinated polymers, low molecular weight inorganics and vegetable polysaccharides (Fig. 5). Among them 5 contain nanoparticles in the formulation, in particular  $\text{Ag}$ ,  $\text{SiO}_2$ ,  $\text{TiO}_2$ ,  $\text{ZnO}$  nanoparticles (Fig. 6). Organic solvents are the most used in the formulations (Fig. 7).

Commercial protective coatings: Solvent

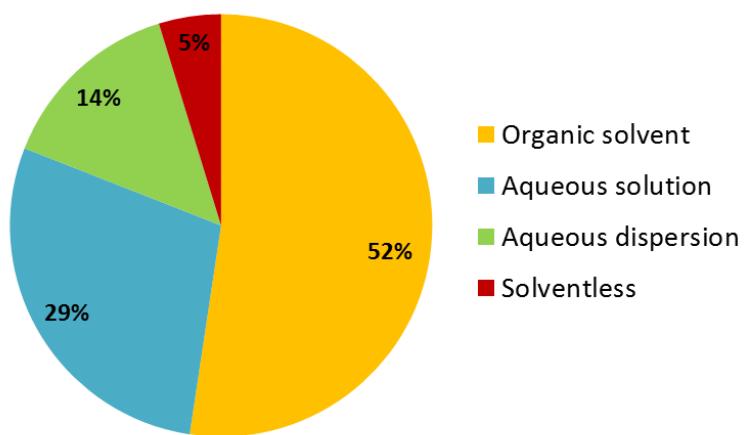

Fig. 7: solvents used in commercial protective coatings.

### 3.2 Research products

Among research products the total number of consolidants is 39, 2 of which have also antifouling properties. They can be divided in 4 main chemical classes: alkoxy-silane and oligomers, acrylics, low molecular weight inorganics and products of biomineralization (Fig. 8). A wide range of nanoparticles have been used in the formulation and in particular nano-SiO<sub>2</sub> is the most used one (Fig. 9). Organic solvents are the most used in the formulations (Fig. 10), which have been applied on different stone substrates (Fig. 11), following different application methods (Fig. 12).

The total number of protective coatings is 27, 4 of which have antifouling properties and 2 of which have both properties. They can be divided in 4 main chemical classes: alkyl-alcoxy-silane oligomers, alkyl-aryl-polysiloxanes, acrylic polymers, fluorinated or partially fluorinated polymers, oxalates, low molecular weight inorganics and aliphatic polyester (Fig. 13). Also for research protective coatings, a wide range of nanoparticles have been used in the formulation among which nano-TiO<sub>2</sub> is the most used one (Fig. 14). Organic solvents are the most used in the formulations (Fig. 15), which have been applied on different stone substrates (Fig. 16), following different application methods (Fig. 17).

Additives	
Additives	Catalyst
Others (specify)	Neutral/hydrophobic additives

NOTES	
Gel deposit rate: approx. 30 % (approx. 300 g/l). Suitable for the consolidation of medium pored, absorbent and friable mineral building materials, preferably sandstone, with hydrophobic effect at once. It can also be used to strengthen historical renders and joints. In the case of stone that has pronounced swelling and shrinking properties because of swelling capable clay minerals, a pre-treatment with Remmers Antihygro (Art. No. 0616) to reduce swelling is recommended.

NOTES	
"Soft strengthener" - suitable for strengthening fine-pored and low strength mineral materials. Low gel deposite rate approx. 10 % (100g/l). It can also be used to strengthen historical renders and joints. In the case of stone that has pronounced swelling and shrinking properties because of swelling capable clay minerals, a pre-treatment with Remmers Antihygro (Art. No. 0616) to reduce swelling is recommended. Within the "Remmer-Baukastensystem" it is used as first step of consolidation. Former saled under name "Funcosil KSE ..."

Horizon 2020

#### NOTES

Can be used to strengthen absorbent, large pored, strong weathered mineral materials, especially sandstones. It can also be used to strengthen historical renders and joints. In Austria it is used as well for the consolidation of very high weathered limestones. Gel deposit rate: > 40 % (approx. 420 g/l). Widely used in Austria.

In this group are also available:

**KSE 500 E** = Plasticized stone strengthener on a silicic acid ethyl ester (KSE) base. Gel deposit rate: approx. 50 %. Can be used to strengthen morbid and large pored sandstones, particular vulcanites e.g. tuff.

**KSE 500 STE** = Plasticized stone strengthener on a silicic acid ethyl ester (KSE) base with high gel deposit rate (approx. 500 g/l). Contains pure mineral aerosols. It is used in the "KSE-modul-system" as binder for injection mortars (force-locked connection of scales). In the case of stone that has pronounced swelling and shrinking properties because of swelling capable clay minerals, a pre-treatment with Remmers Antihygro (Art. No. 0616) to reduce swelling is recommended for all products.

Former sold under name "Funcosil KSE ...".

Solvent/dispersing medium	
Solvent/dispersing medium	Organic solvent
Specify solvent	Ethanol
Others (specify)	

Additives	
Additives	
Others (specify)	

NOTES	
<b>CaLoSiL-E5:</b> Low concentrated product, recommended for the strengthening of fresco, powdering surfaces and pre-treatment of dense stones; contains 5 g/L Ca(OH) <sub>2</sub> , Particle size: 50-250 nm.	
<b>CaLoSiL-E25:</b> Strengthening of porous stones, mortars and plaster; contains 25 g/L Ca(OH) <sub>2</sub> , Particle size: 50-250 nm.	
<b>CaLoSiL-E50:</b> Strengthening of highly porous materials, filling of micro cracks and small voids; contains 50 g/L Ca(OH) <sub>2</sub> , Particle size: 50-250 nm.	CaLoSiL is a ready-to-use stone and plasters consolidate. Treatment of stone, mortar or plaster with CaLoSiL results in the formation of solid calcium hydroxide after evaporation of the alcohol. That converts into calcium carbonate in a way similar to traditional lime mortars by reaction with atmospheric carbon dioxide. All alcohols evaporate without any residues. Chemicals or residues deteriorating stone or mortar are not formed. CaLoSiL offers very good adhesion properties to mineral building materials, especially calcareous ones. A combination with silicic acid ester (pre-treatment with CaLoSiL) is possible and maintain to higher stability, because of the "glueing" properties of CaLoSiL.
One negative effect could be the so called "white haze formation", which might be either caused by wrong application methods or by back-migration of the consolidant. Using other concentrations, other alcohols (Iso-Propanol or n-Propanol) and pre-testing of different application and curing methods can prevent this effect.

Application method	
<b>Application method</b>	
<b>Others (specify)</b>	

NOTES	
In fact, in vitro experiences have revealed that Sr(OH)2 is able to react both with atmospheric carbon dioxide and with sulphate ions arising from gypsum. Thus as a new sacrificial material it can be used in wall painting and plaster restoration without the toxicity problems typical of barium hydroxide solutions.

Horizon 2020

Application on stone substrates	
Stone substrate	Marble
Others (specify)	Sandstone, Mortar, Wood, Cotton and Ceramic

Application method	
Application method	Brush
Others (specify)	

NOTES
In the present study two improvements are achieved in the aforementioned method. First, a water-based siloxane product is used, replacing thus the harmful organic solvent (white spirit) with water. To the best of our knowledge, waterborne products with water repellent properties, obtained after application/solidification, have not previously reported. Second, siloxane-nano-particle composites are deposited by brush. Therefore, the spraying technique, suggested in our previous works is replaced by an extremely simple deposition procedure.

NOTES	
Aim of the research was to select the best application conditions of the two products on salt-laden stone specimens, investigating as well the dependence of the protective action on the procedures adopted to apply the products. The performance of different concentrations and contact times of the products was tested in the laboratory, paying special attention to the possible drawbacks due to the salt.
